INFILL-CRETE

REVOLUTIONARY WATERPROOFING TECH

INNOVATIVE BASEMENT WATERPROOFING & CRACK REPAIR TECHNOLOGY

POWERED BY:

INFILL-CRETE - INTERIOR/EXTERIOR

APPLIED TO CONCRETE STAIRS, FLOORS, CEILINGS, CRACKS & MORE!

WHAT IS INFILL-CRETE?

It is a high performance waterproofing system comprised of:

A water chasing sealer, deep penetrating crack & joint filler, an advanced elastomeric top coat.

A penetrating, reactive, waterproofing material that uses industrial grade waterproofing tech to deeply penetrate concrete.

IS INFILL-CRETE SAFE?

It's an environmentally friendly & 'green' product.

It has zero VOC's or solvents. Safe for children & pets.

It creates a seal that stops water before it enters your basement.

It is exclusive, permanent & cost effective!

WHY INFILL-CRETE?

Can be applied at subzero temperatures

Works on concrete, asphalt, brick, stone, wood & metal

Eliminates water, humidity, efflorescence & mildew

Creates an active vapor barrier that reduces radon

Fast application, can be completed in one day

A person wearing a white long-sleeved shirt and a black cap is kneeling on a blue mat, applying a white sealant to the corner of a wall and floor. The sealant is being applied with a roller, creating a thick, textured layer. The wall is a light beige color, and the floor is a dark grey concrete. The scene is brightly lit, highlighting the texture of the sealant.

WHERE DO YOU APPLY INFILL-CRETE?

On the 'cold joint' where your cement floor meets your cement wall

It can be applied to the entire cement floor

It is normally applied a foot on the floor & up to 3' on the wall

Inside & around cracks to fully seal & waterproof

On cement stairs & cement ceilings

It can also be applied to exterior wall foundations & cracks

WHY CHOOSE INFILL-CRETE?

There is no need to jackhammer the perimeter of your basement.

It does not weaken your foundation, rather it reinforces it.

It is applied directly to the cement, cinder block or rock foundation.

Less dust and demolition in your home.

CONCRETE LOVES WATER!

Concrete is porous by nature.

Concrete only dries out if the soil surrounding your basement dries out.

Up until now, all waterproofing coating tried to bond with the surface of concrete.

However, water moves through the surface of the concrete

Water evaporates into your basement causing moisture and humidity.

MECHANICAL SYSTEMS / FRENCH DRAINS

The French Drain was invented by Henry French in the 1800s

It is an old system that works, but also weakens your foundation.

A jackhammer rips open the perimeter of your basement in order to make room for a perforated PVC pipe to lead water to your Sump Pump.

Mechanical systems fail, they actually bring water in to your basement.
